Both agree...
TUBEX saves
time and
labor

During your day, when every moment is important, TUBEX cuts your workload. It provides more time for other important patient-care needs. TUBEX is ready in seconds. It assures accurate dosage, aseptic conditions, and minimizes pain on injection—always a new sharp needle. TUBEX is prefilled and ready to inject, unlike the disposable syringes, many of which must be filled by hand. The use of TUBEX reduces the chance of medication error, the risk of serum hepatitis, and the possibility of malpractice liability. Of particular interest, too, approximately 75% of all injectables used are now in the growing TUBEX line.

Consult your Wyeth Territory Manager. He can show you how the majority of your injections can be made with TUBEX.

the American

UTENSIL WASHER-SANITIZER

Protects patients and personnel against cross contamination - - dependably and at less cost.

Prevention of cross contamination from patient utensils is accomplished rapidly, automatically and at reduced cost with the new American Utensil Washer-Sanitizer. The powerful detergent wash, double rinse and steaming cycles are completed in 22½ minutes . . . with no attention from nursing personnel other than loading and unloading. Three sets of utensils are processed in two loads.

The American Utensil Washer-Sanitizer is economical to install and pleasant for nursing personnel to use. It assures uniformly high standards of cleaning and sanitizing by eliminating the possibility of human error . . . and, its modest cost is more than justified by the saving in personnel time alone.

The American Utensil Washer-Sanitizer is available with clean-up counter or as the free-standing unit shown above.

For complete information on this improved utensil technique, write for bulletin SC-321-R.

Control Diarrhea

—and other digestive distress

Pepto-Bismol is a unique, non-opiate formulation which controls simple diarrhea without producing constipation. In most cases, bowel function returns to normal within twenty-four hours.

FOR GASTRITIS: Pepto-Bismol's non-alkalizing, demulcent base helps the stomach return to normal activity without inhibiting digestive acids, without "acid rebound" or alkalosis.

FOR ENTERITIS: The soothing coating action of Pepto-Bismol is also highly effective in the intestinal tract—offers safe relief from both physical and psychosomatic disturbances.

Safe and effective for children as well as adults

Pepto-Bismol[®]

Active ingredients: Bismuth Subsalicylate, Salol, Zinc Phenolsulphonate and Methyl Salicylate Synthetic in a demulcent base. Note: The bismuth salts in Pepto-Bismol may cause a temporary darkening of the stool.

Two happy people . . . thanks to
Dennison Diaper Liners

It's not surprising that many new mothers first learn about Dennison Diaper Liners from their nurses. For who can know better than *you* how these Liners help make *both* mother and baby happier and healthier.

Baby's happier and healthier because these smooth, soft, lint-free Liners — worn inside regular cloth diapers — retard the growth of ammonia-forming bacteria which is one of the principal causes of irritating diaper rash.

Mother's happier because her diaper washing is breeze-easy. She just lifts out the soiled Liner intact and flushes it away. She doesn't have to handle messy or badly soiled diapers . . . nor soak and scrub them to get rid of stubborn stains.

Dennison Diaper Liners help diapers last longer . . . cost less than a penny a change.

Recommend Dennison Diaper Liners to your patients.

New sheerness in on-duty elastic hose

Now in White

On duty or off, you'll find elastic stockings like those above in white or natural street shade. Other Bauer & Black models in nylon or cotton, above or below knee style, open or closed toe, at a variety of prices.
Also available in black for ecclesiastical wear.

These Bauer & Black nylon elastic stockings look just like regular nylons

Here at last are white nylon elastic stockings you don't need to hide under overhose. They're full-footed ... look just like regular nylons.

Yet, for all their sheerness, they give exceptional wear and remedial support ... even though you're on your feet for long stretches at a time.

Leave it to Bauer & Black, the leader, to develop these sheer, finely fashioned elastic stockings. They retain their whiteness ... are quick-drying ... light and cool ... with non-binding heel and toe. Be sure you have several pair.

BETTER TOTAL EFFECT

in the relief of pain of

HEADACHE • NEURITIS • NEURALGIA

Anacin Tablets are optimally successful in the relief of simple pain. They exceed the benefits of plain aspirin and buffered aspirin by giving a 'better total effect.' That is, Anacin not only relieves the pain but also lessens emotional tension and leaves the patient more relaxed. The mild sedative action of phenacetin—double that of aspirin—induces a 'restful' state in which the reparative forces are nurtured. Tolerance is excellent. Anacin does not upset the stomach. Why not give consideration to Anacin as the non-narcotic analgesia of your choice?

ANACIN[®]

WHITEHALL LABORATORIES, NEW YORK 16, N. Y.

RN *letters*

HAIL, ANESTHETISTS!

DEAR EDITOR: The remark is often made that "it looks pretty easy to sit at the head of the operating table and administer anesthetics." Yet I know of no nursing specialty more highly technical than the anesthetist's.

True, a bit of antagonism exists toward us in some operating theatres. But far more prevalent is the wide respect shown us. And there appears to be less friction among anesthetists than among nurses in any other group.

Helen N. Gullord, C.R.N.A.
Bricelyn, Minn.

R.N.-L.P.N. FRICTION

DEAR EDITOR: Friction between R.N.s and L.P.N.s inevitably lowers the quality of patient care.

Many contend that the cause of this friction is snobbery on the part of the R.N.: She's presumed to feel "superior" to the L.P.N.

Others claim that the R.N. feels insecure; that she sees her job being threatened by the increasing employment of L.P.N.s in hospitals (up 35 per cent between 1950 and 1955).

But note this: Where the friction

is greatest, there's almost always confusion about the role each group should play in effective patient care. Clarification of these roles is essential if the R.N.-L.P.N. relationship is to be harmonized.

Joanne C. McCaren, R.N.
Jamaica Plain, Mass.

DEAR EDITOR: One of your correspondents would like to have R.N.s "spared the humiliation of being placed in competition with practical nurses."

Basically, no such competition exists. Nor would it even seem to exist if all nurses were to take care of the sick and forget about lines of demarcation.

R.N., New Jersey

T.L.C. FOR SMALL FRY

DEAR EDITOR: All too often I find an attitude of impatience toward the parents of a hospitalized child. Not only are their visits limited by hospital rules; sometimes they're told it's better for the child if they don't come at all!

A hospital can be a frightening place to a youngster left suddenly among total strangers. Consider an example I know of at first hand—

© 1958, SCHERING CORPORATION, BLOOMFIELD, NEW JERSEY.
ALL RIGHTS RESERVED. CN J 858

letters

that of a happy, friendly 2-year-old boy:

On his admission to the children's ward, the doctor advised his parents not to visit the child. They complied.

Two days later, when they went to bring him home, they found a cowering, fearful child. He was afraid even of his parents. He recoiled when they tried to undress him for bed. Apparently he was scared to death of being jabbed with another needle.

Weeks later he still cries when he thinks he's being left alone.

We can only hope and pray that the effects of this little boy's experience won't be lasting—that later in life a psychiatrist won't have to probe into his childhood to get at the basic cause of some mental disorder.

Mary E. Helton, R.N.
Berea, Ky.

NO RESPECT SHOWN

DEAR EDITOR: When my baby was a year old, I applied for general duty on week-ends at a local hospital. I was accepted as a "float nurse," then given an aide's assignments. The implication was: "That's all you're fitted for, working week-ends only."

Naturally I resented this attitude. I felt I could give good nursing care, what with my three years' experience (one as charge nurse). Besides, I'd been away from active duty only a year or so. *More* ►

REED & CARNRICK JERSEY CITY 6, NEW JERSEY

letters

After two week-ends of such duty—during which there was no sign of respect for my R.N. status—I resigned.

The hospital I then went to work for (same schedule) treated me quite differently. I was shown as much respect and consideration as any full-time R.N.

Other married nurses I know tell me they've also encountered rough treatment on returning to active duty. No wonder more of them aren't working now!

R.N., Illinois

'WHERE'S THAT KEY?'

DEAR EDITOR: A ward nurse can lose precious time if the key to the medicine closet isn't readily available. (Maybe the key is in the pocket of the charge nurse, who's busy elsewhere on the floor. Maybe she's even gone home with it.)

So, why not a dial-type combination lock instead of the kind that requires a key? Each nurse could then be told the combination when she's being oriented to the ward—and much lost time could be saved.

Mary M. Sneyers, R.N.
Newark, N.J.

JOB SHIFT EXPEDITED

DEAR EDITOR: When a nurse leaves Hospital A to seek work in Hospital B, she may lose a week's pay while her record and references are being checked by B.

I know of two instances in which this likelihood was averted. Hospi-

*All-day freedom from tired,
aching feet—in seconds!*

*with **EEZ*** Spray Powder*

For happy healthy feet

EEZ is a new type foot conditioner that instantly refreshes, soothes and deodorizes.

EEZ "cushions" feet against rubbing. Ends tired, burning discomfort. Keeps feet feeling fresh and comfortable.

For Athlete's Foot Discomfort

EEZ is an effective medication for fast relief of Athlete's Foot discomfort.

EEZ relieves itching . . . cools tender, irritated skin instantly. Your hands never touch the infected area. You simply spray EEZ from its modern aerosol spray container.

RN news

X-Rays Called Risky Late in Pregnancy

Leukemia in a child may be related to X-ray pelvimetry in the last trimester of the mother's pregnancy. So says a group of Tulane University physicians whose studies indicate that malignancies have a slightly higher-than-average incidence among the children of mothers so X-rayed late in pregnancy.

"Even a mild dose of radiation may then cause mutations in the genes of mother and child," warns Dr. Edward L. King, chief of the study group.

Philodendron can cause a dermatitis like that produced by poison oak, say Drs. Samuel Ayres Jr. and Samuel Ayres III in the Archives of Dermatology. The doctors report having treated twelve of their patients for blisters and red blotches on hands and forearms that appeared after contact with the plant.

Drugs for Shock work by increasing blood flow to the heart and brain while reducing the supply to other vital organs. A team of investigators, headed by Dr. Eliot

Corday of the University of California at Los Angeles, reports increases up to 500 per cent in the heart-brain blood supply after vasopressor drugs have been given. Liver and kidneys—organs less sensitive to a lack of oxygen—manage meanwhile with less blood, the investigators find.

Law Tightened on Use Of Food Additives

A recent amendment to the Federal pure food law requires the manufacturer or promoter of a new food additive to test it on laboratory animals and to submit the results to the Food and Drug Administration for approval. Until the safety of the additive is established, its use in food processing will not be permitted, says the F.D.A.

Tapeworm Cure Called Safe, Effective

Pork and beef tapeworms can be removed from the G.I. tract by duodenal lavage with nontoxic drugs, say Drs. Sidney W. Rosen and Everett D. Kiefer of Boston in a report to the A.M.A.

Glycerine, magnesium sulfate, and saline solution, warmed to 130

news

degrees F. and introduced through a Rehfuß tube, enable most patients to expel the entire worm (with scolex or head attached) within fifteen minutes, the clinicians report. In thirty-six of forty patients over age 12, a complete cure was observed, they add.

Medical Center Plans Underground Units

The underground hospital is closer to realization than you may think. Some of the nurses in the Newark, N.J., area expect to be working in one by 1960, when the new 650-bed St. Barnabas Medical Center is scheduled for completion.

Present plans call for the location below street-level of operating rooms, intensive therapy units, and facilities for emergency care. Also planned are shelter areas to protect patients, staff, and neighborhood residents in the event of atomic warfare.

Estimated cost of the project: \$12,000,000.

Squatting for Delivery Favored by M.D.

A West Coast doctor has revived clinical interest in the world's oldest method of delivering babies. (Peasant women, you'll recall, often took but a few minutes out

FAST, CONVENIENT, EASY TO USE. Just slip the Cuff around any size adult arm ... hook ... and you're ready! Gage is attached to cuff, minimizing danger of accidental dropping. from their work in the fields to squat down and deliver their infants.)

Dr. Forrest H. Howard of Garden Grove, Calif., describes his technique in *Scope Weekly*:

The patient is placed on the delivery table in lithotomy position, with her legs in stirrups—as for a conventional delivery. The specially constructed table is then tipped forward 90 degrees so that the mother is sitting upright. Exceptionally broad stirrups are used to achieve adequate weight distribution.

"The mother finds the sitting posture comfortable and satisfac-

tory," says Dr. Howard. "From the physician's standpoint, it is a good deal easier to extract the baby . . . and it impresses me as reducing the risk of intracranial damage."

New Blood-Sugar Test Done in 5 Minutes

Emergency diagnosis of insulin shock or diabetic coma can be confirmed within five minutes by a new blood-sugar test, says Dr. James M. Moss of Georgetown University. All it requires, he reports, is a 1-ml. blood specimen and a Dextrotest kit containing two test tubes and two reagent tablets. The results (determined by a color scale) show

values between 100 and 250 mg. of sugar per 100 ml. of blood.

The test is not intended to replace standard methods of blood-sugar analysis, says Dr. Moss, but it offers a quick check in an emergency; it helps to detect otherwise asymptomatic diabetes; and it facilitates hourly blood-sugar checks on patients with diabetic acidosis.

Bed Rest for TB Called Harmful

Strict bed rest for tuberculosis patients is no longer worth the price, says Dr. William B. Tucker of the Veterans Administration. Prolonged confinement to bed "uncon-

ditions" TB patients, he says, and causes profound changes in their psyches. He adds that these harmful effects need no longer be risked now that such drugs as isoniazid and PAS are available.

Blanket Bag Helps In Germ Control

Can you always be sure each new patient is getting a blanket that's been laundered since its last use?

You can be if your institution follows an infection-control procedure adopted by the North Carolina Memorial Hospital in Chapel Hill.

There, each blanket is returned

from the laundry in a sealed plastic bag that keeps it clean and dust-free, even during prolonged storage in a linen closet.

When needed, the wrapped blanket is brought to the bedside by a nurse or aide. It remains there till the patient is discharged—whereupon it's immediately relaundered.

The empty bag is either discarded by the nurse or used by the patient to take home his personal effects.

Dr. Robert R. Cadmus recently reported this procedure to the American Hospital Association.

Clue Hints at Cause Of Schizophrenia

A chemical deficiency in the "blood-brain barrier" may cause schizophrenia and other mental diseases, says Dr. Samuel Bogoch in the Archives of Neurology and Psychiatry.

In his studies of adult schizophrenics, Dr. Bogoch has detected a deficiency of neuraminic acid in the cerebrospinal fluid; and since this acid appears to play a role in the function of the blood-brain barrier, he reasons that an inadequate supply may permit body chemicals to pass the barrier, come into prolonged contact with the brain, and produce mental illness.

'It Won't Shake Off!'

BETTER HEARING... NOT "BETTER HIDING" is what's important in Hearing Aids!

In Zenith's opinion, all too much emphasis is being placed today on the size and concealing qualities of hearing aids. Not enough is said about the advantages the hard-of-hearing should really look for when they buy a hearing aid.

One would almost believe that a hearing aid only needs to be smaller and less conspicuous to be a *better* hearing aid. That the best possible of all conceivable hearing aids is an *invisible* one.

Of course, there is no such thing as an invisible hearing aid at this time. If it were possible to make one, Zenith, with its vast resources and 40-year experience in the field of sound reproduction, would have developed it.

What is possible (and Zenith has proved it) is to develop remarkable precision instruments that reproduce sound with such amazing clarity that,

to users, hearing is a pleasure again. Zenith dealers offer a hearing aid model for every electronically correctable hearing loss.

True—Zenith has achieved great progress in making hearing aids smaller and less conspicuous, but we have never sacrificed hearing aid quality and performance for size. Zenith and Zenith dealers will always place cosmetic advantages second to *hearing aid performance*.

We recommend that anyone with a hearing loss *see a doctor first* . . . then, if the loss is correctable, to select the hearing aid that offers *greatest hearing help*.

A modern, precision hearing aid can bring a wonderful new life to the hard-of-hearing. Helping them to enjoy its full benefits is a privilege—and a challenge—to us. It's part of the Zenith Crusade.

Drug Administration. Cracking down on the advertising of several such devices, the agency says it's illegal to promote them as weight reducers or cure-alls for disease.

"According to expert medical opinion, the benefits of vibrators are limited to temporary relief of minor physical conditions," the F.D.A. observes. It adds that it has recently confiscated eleven different devices for which false claims were made.

Fluorescent Lighting is neither harmful to the eyes nor a cause of visual discomfort if properly installed and maintained, says an American Medical Association committee after a recent investigation.

New Contact Lenses Said To Aid Side Vision

Some 15 per cent of the side vision lost by wearing spectacles can be regained by switching to plastic corneal contact lenses, says Robert M. Eret in *Today's Health*. Such lenses also have these added advantages, he says:

¶ A prescription for the corneal lenses will last at least three years (and possibly twenty), compared with a year or two for common spectacles.

¶ Bifocal prescriptions can now be ground into corneal contact lenses.

¶ They're easy to keep clean, since plastic doesn't attract grease.

¶ They can be worn for periods of up to eighteen hours at a time.

Mr. Eret estimates that nearly 4,000,000 people are now wearing these tiny "invisible glasses," which measure only about one-third of an inch in width.

Social Security Taxes Go Up Next Month

Starting January 1, the Social Security tax rate jumps from 2¼ to 2½ per cent for both you and your employer. (If you're self-employed, you'll pay 3¾ instead of 3⅜ per cent.)

What's more, these new rates will apply to all wages up to \$4,800 a year—not the current \$4,200.

The added taxes are authorized by Congress to finance a January 1 increase of about 7 per cent in the monthly benefits payable to retired and disabled workers and their dependents.

Pony Tails can make girls bald, says Dr. Albert Slepian in the *Archives of Dermatology*. Pulling the hair up and back for long periods may produce what he calls "traction baldness." Dr. Slepian reports having observed this phenomenon in twenty-four young girls over the past two years. In all but two cases, he says, the symptoms vanished after a change of hair style. **END**

That Curb Coughing

By Morton J. Rodman, PH.D.

What should you do to stop a cough? In most cases, nothing. For coughing is the body's way of keeping the lungs clear. And not being able to cough when you need to can kill you quicker than the worst coughing spell.

Still, some coughs should be treated before they become

chronic. Long-continued coughing can result in loss of sleep and appetite. By damaging delicate lung membranes, coughing can cause pulmonary emphysema and other breathing difficulties. It can also make a minor infection serious by spreading germs deep into the lungs. And, of course, spreading from coughs can

THE AUTHOR is Professor of Pharmacology at the College of Pharmacy, Rutgers University, Newark, N. J.

DRUGS THAT CURB COUGHING

transmit disease to other persons.

Most coughs come from membranes inflamed by a cold or other upper-respiratory infection. But coughing can also be a sign of more serious diseases—diseases for which a cough mixture is simply not enough.

Cough remedies used to be often thrown together with little or no scientific basis. Today, there are drugs that really work. And we know how to use older drugs more effectively.

Most drugs for coughs act either (1) by reducing the cough center's responsiveness to incom-

Antitussive Drugs

1. Centrally Acting Cough Suppressants

Narcotic Antitussives

Codeine phosphate, U.S.P., and codeine sulfate, N.F.
Dihydrocodeine bitartrate (drocode; Rapacodin)
Dihydrocodeinone bitartrate, N.F. (Dicodid; Mercodinone)
Dihydromorphine HCl, U.S.P. (Dilaudid)
Ethylmorphine HCl, U.S.P. (Dionin)
Levorphanol tartrate, N.N.D. (Levo-Dromoran)
Methadone HCl, U.S.P. (Dolophine; Adanon; Amidone)
Morphine sulfate, U.S.P., and Morphine HCl, N.F.
Purified opium alkaloids (Pantopon; Omnipon)

Nonnarcotic Antitussives

Caramiphen ethanedisulfonate (Toryn)
Carbetapentane citrate, N.N.D. (Toclase)
Dextromethorphan hydrobromide, N.N.D. (Romilar;
Dormethan; Methorate; Tusilan)
Dimethoxanate HCl (Cotherra)
Noscapine, N.N.D. (narcotine; Nectadon)

ing messages, or (2) by attacking the cough at its source in the respiratory tract.

Drugs that depress the cough center are among the most effective cough stoppers. But they should be used only to cut down coughing—not to eliminate it and thus bottle up infection.

Morphine is still the best agent against painful coughs, such as those caused by lung cancer or a broken rib. And because it relieves anxiety and pain, morphine may also be good against cough caused by pulmonary edema following a heart attack.

But giving morphine requires

Used in Cough Remedies

2. Some Expectorant and Demulcent Substances

Ammonium chloride, U.S.P.
Ammonium carbonate, U.S.P.
Potassium iodide, U.S.P.
Sodium iodide, U.S.P.
Calcium iodide
Antimony and potassium tartrate, U.S.P.
Ipecac (fluidextract and syrup, U.S.P.)
Squill (compound syrup, N.F.)
Creosote, N.F.
Guaiacol, N.F.
Glyceryl guaiacolate
Potassium guaiacolsulfonate
Pine tar syrup
Tolu syrup
White pine syrup
Wild cherry syrup
Eucalyptus oil
Turpentine oil
Terpin hydrate

3. Miscellaneous

(Anti-allergic, broncho-dilator, decongestant, sedative, local anesthetic, and other agents)
Aminophylline, U.S.P.
Papaverine HCl, U.S.P.
Dihyprolone (Sedulon)
Benzonatate (Tessalon)
Ethylaminobenzoate (Benzocaine)
Anticholinergics (example: Atropine sulfate)
Antihistaminics (examples: diphenhydramine; Benadryl)
Sympathomimetics (examples: phenylephrine; Neo-synephrine)

DRUGS THAT CURB COUGHING

great care. It may deeply depress respiration. And there's always the danger of addiction.

So for less serious coughs, most doctors prefer codeine and its sister compound, dihydrocodeinone (Dicodid; Mercodinone). Codeine effectively protects the cough center from many irritating impulses. By keeping all but the strongest impulses from breaking through, it makes coughing less frequent but more effective.

Of course, there's some danger of addiction even to codeine. And it can cause all sorts of side effects, such as constipation, drowsiness, and dizziness.

Codeine Substitutes

So chemists have been looking for synthetic substances safer than codeine and free from its ill effects. And recently they've come up with some promising compounds.

One of these, dextromethorphan (Romilar) is a close relative of certain narcotic pain-killers. But, oddly enough, it does not relieve pain; nor does it cause addiction. Instead, it specifically depresses the cough center. And it does so without causing opiate-type toxicity.

Other synthetic drugs—caramiphen, ethanedisulfonate (Toryn) and carbetapentane citrate (Toclase)—suppress the cough reflex without the danger of addiction or toxicity. They also have some spasm-relaxing effect on constricted bronchial tubes.

A recently rediscovered opium alkaloid, noscapine (Nectadon), seems to have this same double-barreled action. And another new drug, benzonatate (Tessalon) looks promising too. It not only lessens the sensitivity of the cough center to incoming impulses but also seems to stop them at the source by anesthetizing sensory receptors in the lung lining.

Other drugs work in different ways to reduce the number of impulses passing from the respiratory tract to the cough center. Some—the demulcents—are but sugary substances that coat the throat and keep it moist. (A candy cough drop does this too, by stimulating saliva flow.)

Unlike the demulcents, the expectorant drugs act only after they're swallowed. They increase the flow of fluid in the tracheo-bronchial tree below the throat. This fluid is a natural lubricant that protects dry, irritated mu-

cous surfaces. It also dissolves solidified secretions and washes them away.

What sets off this increased secretory activity? Some expectorants act by irritating the stomach. Salts (such as ammonium chloride) and emetics (like ipecac) trigger a reflex action that results in a flow of fluid from glands lining the respiratory surfaces.

Some expectorants stimulate these glands while being excreted on the breath. Various volatile oils—eucalyptus, pine, and turpentine—are in this category. So is the related drug, terpin hydrate; but this drug doesn't really do much good in the small dose contained in the popular Elixir of Terpin Hydrate, which is effective only as a palatable vehicle for codeine.

Still other expectorants work both ways. Taken by mouth, they set off secretory reflexes. After absorption, they are excreted through the lungs, stimulating the glands as they go. The creosote and guaiacol derivatives and the iodides have this double fluid-forming action.

Potassium iodide is an old stand-by for asthmatic cough. It helps melt mucous plugs block-

ing the bronchial tubes. And once the viscosity of such secretions is reduced, they're easier to dredge up from deep in the chest.

But iodides are rather nasty to take. Single doses sometimes cause nausea. And prolonged use may cause chronic iodine toxicity or "iodism."

A patient with this condition may just seem to be suffering from a heavy cold. His nose and eyes run and itch; he sneezes; and he may have a slight fever. But these symptoms, together with such signs as redness and acne-like eruptions, disappear when the drug is discontinued. So it's important to recognize the signs and report them to the doctor.

Though the old-fashioned iodides still have a place in cough treatment, most of the other old expectorants are on the way out. They're being replaced by modern synthetic substances.

Doctors can now control most coughs by combining just a couple of these new compounds. Soon, they may be able to give a single substance that combats all kinds of coughs. So the days of the complex cough mixtures that still clutter the market are probably numbered. END

PANDEMONIUM

on the P.M. Shift

How hectic can nursing get? For the answer (with laughs), read this hilarious tale of 3-11 duty in a small hospital

By Joyce Lane

Dear Hattie,
This is a delightful little town. And—surprise!—we even have a three-ring circus here!

That's a fair description, I think, of the 3-11 P.M. shift in a country hospital with twenty-five beds and an emergency room. At least it's a fair description of ours.

Yesterday afternoon and evening were typical. The day staff was gone when two aides, an orderly, and I went on duty.

"Holy mackerel," the surgical nurse yipped. "Are you the whole P.M. staff?"

We were. So you can imagine what this did for our morale.

We didn't have much time to brood about it, though. The utility room was piled with an array

of soiled utensils that looked like the leaning tower of Pisa. Each linen cart had a load that would have done credit to W. C. Fields in his heyday.

On the desk was a collection of unfiled charts. On the charts were the gluteal parts of a collection of doctors engaged in their favorite sport of panning pathologists.

The hallway was a Times Square of signal lights. From one door came the sound of a patient

banging an empty water pitcher on his bedside table. Another doorway emitted a white streak that turned out to be one of the day shift making tracks for a late-afternoon date.

One of our first jobs was a patient who had to be prepped for a hip pinning. We'd hardly got started on that when the ambulance roared in with five victims of a car crash.

It seemed that two cars had tangled; and the passengers of both arrived at the same time. All of them were ambulant—but irritable. They took a dim view of my asking questions about their religion, their employment, and whose husband was whose.

The aroma of Old Overholt hung over this fivesome like a fog. And it did little, believe me, to speed the process of sorting them and suturing them.

Four of our new-found friends, the doctor finally decided, could weave their way home with no further aid. The other was to be admitted—a chore complicated by the fact that the admitting office here closes at 5, after which admissions become the responsibility of yours truly.

Incidentally, I hadn't made

PANDEMONIUM ON THE P.M. SHIFT

rounds yet. But the routine here is refreshingly flexible. Sometimes we don't make rounds until 8 or 9 P.M., by which time I've seen all the patients anyway.

Our pickled admittee had to be X-rayed. But the X-ray technician said nothing doing until she'd finished her hip case.

The doctor got pretty huffy about this, making sundry comments about elective surgery being done at night, about all the house calls he still had to do, and about his wife waiting to be driven to a P.T.A. meeting.

The technician still wouldn't budge, though. She explained with some emphasis that she was just one person, that she just obeyed orders here, and that the surgeon had ordered first.

The doctor retorted that, what the heck, woman, he could take *both* sets of films himself in no more than two minutes if he knew how to run the machine, and that, hang it, while she was arguing she could have done the job. Whereupon the technician closed the darkroom door on us.

None of our courses in nursing school had prepared me for this. I decided to serve our emergency case some strong black coffee and to placate the doctor with a

ham sandwich coaxed from the cook—who yelled after me that tomorrow she was quitting; that this shift was too much, what with people eating at all hours and the dishwasher not allowed to work overtime; that she certainly didn't know what *I* was going to eat; and so on.

Foreign Complications

At this moment a gentleman of foreign extraction rushed up, saying that his wife had got sick in the car and "Pleasa, you come queek!"

The doctor, sitting on the waiting-room bench, put down his sandwich and said, "What kind of sick?"

"Real sick," said the man. "She gotta pain in the meedle. She say hurry."

The doctor pushed past us on the double. I followed.

Soon we came to a battered old sedan with a large mattress strapped to its top. Six small kids, hanging out the car windows, were yelling bloody murder.

It wasn't long before I figured that this sort of thing must have happened before, that the doctor must be actuated by a reflex like that of jumping out of bed when

the alarm clock rings. Anyway, in short order—and under not exactly aseptic conditions—we delivered the couple's seventh.

Mamma and child were soon admitted and we pressed the doctors' dressing room into service as an isolation nursery. (The

M.D.s could change in the shower, somehow!)

Outside, meanwhile, with the blessed event over, Poppa and the six kids piled back into the car and drove off to celebrate on hamburgers and root beer, financed by the doctor. *More ►*

WHAT YOU NEED TO KNOW ABOUT AIR TRAVEL

Pregnancy—if uncomplicated—is not regarded as a deterrent to air travel. But as term nears, airlines require written assurance from the woman's doctor that she won't deliver for at least seventy-two hours.

This and other medical aspects of air travel are summarized by Lieut. Col. Frederick S. Spiegel of the Air Force in a report to the American Medical Association. Says the report, in part:

¶ Diabetics dependent upon insulin are required to have a supply, together with a syringe, ready for instant use.

¶ A person with a communicable disease must have a permit from public health authorities for interstate travel.

¶ Airlines don't usually carry infants less than 6 weeks old. But this rule may be waived if a baby's fitness to fly is certified by a pediatrician.

¶ Children under age 5 are five to ten times as prone to airsickness and ear trouble as adults.

¶ Women get airsick five times as often as men. END

PANDEMONIUM ON THE P.M. SHIFT

By this time the pinned hip was back from surgery and one of the aides was sitting with her. I asked the orderly to mop up; but—apparently because I'd forgotten to send him to supper earlier—he went off muttering that it was time for the workers of the world to unite; that some people had no consideration; and that, besides, his doctor had said not to drag that heavy mop bucket around or he'd be down on his back again.

While this was going on, something akin to a bomb blast occurred in one of the rooms down the hall. Two doctors had decided to remove a cast there, and it looked as though the whole ceiling had collapsed.

Call a Plumber!

Thank heaven the aides here have no ideas about uniting. So we finally got most of the debris cleaned up. Before I could stop her, though, one aide emptied the plaster bucket into the toilet. The plumbing complications that followed can be told in one word: Oy!

By this time one of the doctors was complaining that there was nothing on his patient's chart for the evening; and how could

he write orders if he didn't know what had happened so far. Investigation showed that nothing *had* happened. That was the trouble. The patient hadn't had a B.M. for four days. I could see my homework all cut out for me.

Is He Still Here?

The orderly then told me that there was a man sleeping on a stretcher in the emergency room. And so he was: our inebriated X-ray patient, forgotten by all except a police officer standing by to escort him to the cooler.

This meant calling the technician back. And something less than pleasantries were exchanged before he-who-got-pinched was finally filmed.

The next two hours were normal—which means we were no busier than ants at a picnic.

At 11:30, after reporting to a none-too-enthusiastic night crew, I sat down to do charts. As I did so, I remembered the words of our senior-year instructor: "A good nurse always checks off duty on time. Not to do so shows reprehensible lack of organization."

Your disorganized classmate,
Jane

*There's One Chance
In Five
That You'll*

Get... VARICOSE VEINS

If you do get them, here's what to do

By Clare Phillips, R.N.

"You can't be an R.N. You don't have varicose veins!"

This quip, tossed my way at the beach last summer, made me think how often varicose veins in nurses are looked upon as a sort of occupational disorder.

Whether or not they actually are an occupational disorder is open to some question. Dr. Alton Ochsner of New Orleans' Ochsner Clinic says varicose

veins are far more likely to be the result of heredity than of one's occupation. As he puts it, "The principal cause of varicosities is an hereditary predisposition. Almost without exception, people who have varicosities are individuals in whom there is a family history of varicosities, particularly on the maternal side."

Primary varicose veins, says

Superficial Venous System

Dr. Ochsner, are caused by a defect of the walls and valves of the veins. (Secondary varicose veins can also occur. These are caused by increased venous pressure or phlebitis.) The defect so impairs circulation that eventually the veins become dilated and tortuous—in a word, varicose.

Dr. Irving S. Wright, Professor of Clinical Medicine at Cornell University Medical College, expresses the opposite view:

"It is true that varicose veins do often run in families. And in such instances there is probably an hereditary or familial weakness of the valves and walls of the veins.

"But most of the patients we see have varicose veins following thrombophlebitis, or they are associated with occupations requiring prolonged standing. There is no question that policemen, bakers, and others who are compelled to stand for many hours daily have a much higher incidence of varicose veins than do those who are able to change their posture frequently."

More of the authorities questioned by this writer agree with Dr. Ochsner than with Dr. Wright. Here's how they de-

scribe the physiological process that results in varicose veins:

Venous blood makes the long trip from the feet to the heart by running straight up your legs, against the pull of gravity. This action is accomplished mainly by residual arterial force and by the pumping action of the calf muscles as they relax and contract when you walk. But it depends also on veins with strong walls to exert constant pressure on the rising column of blood and on valves efficient enough to trap the blood momentarily at each of several levels and to keep it from flowing down again. Strong walls and valves are especially important in the saphenous or superficial veins that get little or no support from the leg muscles.

Normally, the saphenous veins do their job well. But in one of every five women and in one of every fifteen men the venous walls are thin and inelastic and the valves are incapable of closing tightly to prevent backward flow.

If the valvular defect is serious, varicosities begin to show up during the teens. More usually, they appear between the ages of 30 and 35. (Child-bearing

VARICOSE VEINS

women often notice them during the second or third pregnancy. The pressure of the gravid uterus interferes with venous return, putting extra stress on the vein walls and valves.)

When a woman predisposed to varicosities becomes a nurse, she subjects her already weak venous system to considerable pressure. If she stands all day, as most O.R. nurses do, or if she sits a lot, as she may do in a doc-

tor's office or a school, the venous blood tends to stagnate in her lower legs.

Under this pressure, the vein walls thin out and stretch still further. The valves lose whatever competence they had. In time, the surrounding tissues may become devitalized. If this condition is neglected too long, it can give rise to eczema, discoloration, and eventually phlebitis and varicose ulcers.

The Trendelenberg Test

You lie down with your leg elevated. Gravity and "milking" empty your superficial veins. Then an Esmarch's tourniquet at the groin closes off the empty veins. (The deep veins remain full.)

For the rest of the test you stand up. If your superficial veins stay empty for at least twenty seconds after you stand, the valves in your communicating and superficial veins are competent.

A feeling of heaviness and fatigue in your legs, getting worse toward the end of the day or during your menstrual period, is good reason to suspect you may be developing varicosities. Cramps in your calf muscles at night or when you go swimming, or itching and swelling around your ankles after a day's work, are also indicative, especially when they accompany the feeling of heaviness and fatigue.

Most of these same symptoms also characterize osteoarthritis of the knee, herniated intervertebral disk, or even flat feet. If you notice any of them, it's time to see a doctor.

One thing the doctor will be interested in is your family history. He may ask, "Does either of your parents have varicose veins? How about other close relatives? Were you ever told that the skin on your feet

3

If your superficial veins fill immediately when you stand, the valves in your communicating and superficial veins are incompetent. In other words, the valves have failed to hold back the flow.

4

If the superficial veins stay empty for twenty seconds after you stand, then fill rapidly when the tourniquet is pulled off, the communicating valves are competent but the superficial valves are not.

VARICOSE VEINS

had a bluish color when you were born?"

These are all signs that you may have inherited defective veins.

His physical examination will probably include a Trendelenberg test to check the competence of your valves (see illustrations). If the test is negative—meaning your valves are effective—the most you'll need will be minor treatment.

Injections, elastic stockings, exercise, and rest periods with the legs elevated are some of the methods used for treating early varicosities.

Why Injections?

The purpose in giving sclerosing injections is to bring temporary relief of symptoms. But many doctors no longer approve the injection method. They say it scars and distorts the veins, makes any stripping operation later very difficult, and carries with it the danger of embolism should a piece of the dead tissue break off. Others say that in selected cases the injection method is valuable and safe, when done according to recently improved techniques.

Good elastic stockings are

often prescribed. Their value lies in the fact that they encourage the movement of blood up the venous tree by exerting a decreasing pressure from bottom to top.

Most doctors seem to prefer the below-knee stocking with open heel and toe. The long ones, though better looking, often crease behind the knee when you sit, acting as a tourniquet on the short saphenous veins. Of course, if you stand all day, this won't happen; in which case the long stockings, properly fitted, may do.

It's a good idea to put on your elastic stockings before you get out of bed in the morning. (The long kind need not be hooked to your girdle right away, for they give enough support even loose.) But if you don't put them on till later in the day, then first drain the blood out of your veins by elevating your legs at a forty-five degree angle for a period of approximately twenty minutes.

Exercise for people with varicosities is almost universally recommended. Walking, bike riding or bicycle exercises, swimming or walking in deep water, deep knee bends—any of the

things that call the leg muscles into play and help massage the venous blood up out of the leg veins—are in order.

Dr. Ochsner suggests some

simple exercises you can do even while at work: Rise on tiptoe from time to time. Flex your toes. Contract your calf muscles.

For those [More on 80]

Let's Have Special Licenses For R.N.-Specialists!

By Marian L. Silleck, R.N.

Why not issue a special license to the R.N. who completes extra schooling and passes a specialty examination in geriatrics, pediatrics, orthopedics, obstetrics, or some other field? At present, many a nurse feels her extra training was in one sense a waste of time, energy, and money, for it has not guaranteed her a better job or a better salary.

Before an R.N. is hired by a hospital, she's of course interviewed in detail, and her past experience is carefully noted. But how often is she then assigned to a job where her experience and training really pay off?

Shorter training time, plus advances in medical knowledge, have made it impossible for a nurse to keep abreast of all modern procedures. In this day of specialization, she can no longer be expected to transfer from one section of a hospital to another and still do the most efficient job.

How many of us panic when we're assigned to a postop heart or lung patient? How many R.N.s can still accurately differentiate between diabetic coma and insulin shock?

It's obviously costly and foolish to ignore special training by placing nurses in positions where they cannot make their greatest contribution. Special licenses for specially trained R.N.s can help nursing maintain high standards in the face of more complex responsibilities. END

Nurses ready 275 children to quit the New York Foundling Hospital's eighty-five-year-old building on East Sixty-eighth Street for a shiny, new \$10,000,000 home on near-by Third Avenue. Oldest of the foundlings to make the move: 2 years. Youngest: 2 months.

Abandoned and neglected children cared for by the Foundling Hospital number about 1,000 a year. Total cared for since the hospital's establishment: 107,286.

Moving Day

Police halt traffic as 170 nurses, thirty Sisters of Charity, and several hundred volunteers usher their charges across the avenue—some in arms, others in carriages, most toddling. The hospital's coadministrator, Msgr. McGuire, speeds them on their way with a prayer:

for Foundlings

"God's Blessing for a Safe Journey." Nearly 1,000 bystanders beamed, applauded, wept. But stuffed toys, real animals, and the big, new outside world so intrigued the tiny travelers that tears among them were few. Only casualty of the trip: a goldfish.

By 3 P.M. the move had been completed. New building sports large rumpus rooms where youngsters quickly made themselves at home. Site of the old hospital building will be used for an apartment house.

Children's quarters occupy seventh, eighth, and ninth floors. Rooms accommodate six cribs or bassinets. There's a nursing school, nurses' residence, and space for thirty-four unwed mothers.

The Risk You Run With PLACEBOS

These 'inactive substances' actually exert a powerful psychological force—so powerful at times that the nurse had better be forewarned of the hazard

By Eileen McGloin, R.N.

The word placebo means one thing to the nurse, another to the pharmacologist. It holds still further meaning to the doctor.

To the R.N. a placebo is the sterile hypo she gives instead of a narcotic, the sodium bicarbonate she puts in an empty "sleeping pill" capsule. It's a way to calm an excited patient without

giving narcotics or sedatives.

To the pharmacologist a placebo is the alternate substance he uses when double-blind testing new drugs. Half the patients in a sample group get the real drug; the other half get a placebo. They don't know which is which; and neither do the nurses who attend them. The test helps show how much of the drug's

action, if any, is due to its pharmacological properties, how much to the power of suggestion.

To the doctor who orders the medication, a placebo is both these things plus one more: It's a potent therapeutic aid that utilizes the patient's faith in his physician.

Dorland's medical dictionary calls the placebo "an inactive substance . . . formerly given to please or gratify a patient, now also used in controlled studies to determine the efficacy of medicinal substances." But the Journal of the American Medical Association says "most dictionary definitions of a placebo are too restrictive [inadequate] for modern usage." The patient's faith, it says, "adds great psychic power to the efficacy of any therapeutic measure and makes the placebo an important adjunct to treatment."

It's this very psychic power that makes the placebo a risky thing to use too freely. "Too risky for a nurse," says one medical authority, "for it borders on practicing medicine."

But what, specifically, is so risky about giving placebos?

"The real risk," says a well-known clinician, "is getting into

the habit of substituting a kind of 'magic' for good nursing care. I don't feel that a nurse should *never* give a placebo on her own initiative. If I know she's a good nurse who uses sound judgment, I'm happy to have her administer an occasional fake sleeping pill instead of waking me up in the middle of the night to tell me Mrs. Jones in 104 can't sleep. But if she made a habit of this sort of thing, I'd no longer think she was a good nurse."

Besides taking a chance of warping herself professionally, the nurse who uses placebos indiscriminately risks masking the patient's real needs. This is especially true in the case of emotionally disturbed patients, says Dr. Keith Fischer, Associate Professor of Psychiatry at Temple University.

"Some patients don't have as much pain as their constant demand for narcotics would seem to indicate," he says. "Yet this kind of complaint may be an important signal—a signal of inner turmoil, for example—that needs and would respond to psychotherapeutic treatment."

"Placebos may help keep such a patient quiet while he's in the hospital. But it's poor therapy

THE RISK YOU RUN WITH PLACEBOS

to send him home with his inner conflict still unresolved. A nurse who's been trained to recognize emotional disturbance is also unfair to herself when she misses this kind of opportunity to put her talents to work."

Dr. Mark Rayport, Associate Professor of Neurosurgery at Albert Einstein College of Medicine, puts it this way:

"A good nurse doesn't *have* to resort to the sterile hypo or the sugar pill. She's got the power of the placebo in her own person. For example:

"Suppose that a patient suddenly insists on being given 'something for my pain.' The first thing for the nurse to determine is whether this is *really* pain or just his way of expressing anxiety and fear. The patient can't make the distinction. He's too upset. The nurse has to *find out* what she can do to help him.

Placebo-Substitutes

"So she begins a process of elimination. She does a few of the comforting, reassuring things like smoothing his pillow and adjusting his light. These alone may allay his anxiety. If not, she tries to get him to put his fear into words. Sometimes if she just

looks unhurried and willing to listen, he'll pour out his whole problem. If none of her nursing measures succeeds, then she's justified in calling the doctor."

Here's a concrete example of the placebo effect a nurse can have on a patient:

A woman with hypertension was admitted to a medical ward. During the night, she began to ask for a "needle." The nurse tried to explain to her that she didn't need one, that the pills she was getting would help her, and that if she would just lie quietly she'd soon fall asleep. The nurse then straightened the woman's bed, brought her some fresh water, and tiptoed out of the room.

Five minutes later, the call light went on again.

"I had a lot of work to do," says the nurse. "I was tempted just to go ahead and give her a sterile hypo. But I don't like to give anything without a physician's order. So I sat down by her bed for a minute, trying to decide whether to wake the doctor or not.

"Do you know what happened then? She reached out and took my hand and said, 'Nurse, I'm going to die with diabetes to-

night, just like my mother did. Why don't you give me something so I'll be asleep when it happens?"

"I was so amazed that for a moment I couldn't talk. She told me then that her mother had died in diabetic coma and that she knew diabetes ran in families. She said she'd heard someone in the admitting office talking about diabetes, so she was sure that that's what she had. Later, when we did not give her any insulin shots, she figured she was so

far gone that we were just going to let her die.

"Imagine how frightened she was! I thanked Heaven that I'd sat down by her bed for that important minute. Now I could really help her.

"I explained the misunderstanding and revealed enough about her condition to convince her that she wasn't going to die. She seemed reassured and, soon after, fell asleep.

"But that wasn't the end of it. Actually, she must have been

THE RISK YOU RUN WITH PLACEBOS

living with this fear for most of her life. For the rest of her stay in the hospital, she needed constant reassurance by everyone on the staff. And when she left we gave her two appointments: one for cardiovascular clinic and the other for mental hygiene clinic."

Taking a few extra minutes to win a patient's confidence, says Dr. Rayport, often saves a lot more time in the long run than simply giving a placebo. Once the patient trusts you, your very presence can have a placebo's effect. So turn to your nursing skills before turning to the medicine cabinet, he advises.

By doing this, you minimize another risk: the remote but very real chance that a patient may have a serious physical reaction to the placebo's psychic effect. Such risks aren't as far-fetched as they may sound.

A nurse in a small hospital in Ohio reports that one night when she was alone in the emergency room, a man was brought in who'd been seriously injured in an automobile accident.

"He was begging for something for his pain," she relates, "but I didn't have any standing orders so I couldn't give him

anything. Since he seemed to be in real agony, and since the doctor was at least fifteen minutes away, I decided to give him a sterile hypo. The minute I did so he went into shock.

He Nearly Died

"Later, the doctor told me he'd been on the verge of shock anyway; and just the psychic effect of getting that injection was enough to push him into it. Fortunately, he pulled through. But I don't know what would have happened if he'd died. I suppose I could well have been sued for practicing medicine without a license."

There appears to be some basis for this nurse's concern. According to George E. Hall of the A.M.A.'s legal department, "a nurse who gives a placebo without a doctor's order is in the position of having diagnosed and prescribed in the physician's absence and having thus violated her state's medical practice act."

Though the placebo is an "inactive substance," it nevertheless has important therapeutic power. By learning to use this power wisely, doctors and nurses can make it serve the best interests of their patients. END

Miss Tompkins and God's Angels

BY VIENO JOHNSON, R.N.

When I was a student nurse a good many years ago, our training was based on the same principle that had ordered the "Charge of the Light Brigade": For us it was a matter of do or die—not reason why.

Good performance was expected. Praise was considered unnecessary. We knew we were doing satisfactory work only if we were not criticized.

And criticism was easy to come by. We got it for "hospital corners" that weren't quite square, for chairs that weren't aligned with military precision, for just one wisp of hair out of place.

The lone exception among our stern-minded instructors was a head nurse I had. This nurse—I'll call her Miss Tompkins—was not what anyone would call outstanding. She was plain, a little too buxom, and certainly not brilliant. Yet somehow she managed to create a climate in which patients and nurses were happy and contented.

Indeed, she taught me one of the most important lessons of my life. But she did it so casually that I

MISS TOMPKINS AND GOD'S ANGELS

didn't realize till years later the value of what I had learned.

It started with my assignment to the septic ward in my second year. This assignment did not make me (or any student) very jubilant. All the patients were acutely ill. The ward was a melancholy place rife with that "good old surgical stink" (as pre-Lister doctors used to call the odor of surgical wards). So we named it "Old Stinkhole."

In those days, sulfa drugs and antibiotics hadn't been heard of. Erysipelas and gas gangrene were still fairly common. I'd made up my mind that my tour of duty on "Old Stinkhole" would not be a happy one.

When I reported for duty, Miss Tompkins said pleasantly, "Good morning, Miss Johnson. It's nice to have you with us. I hope you'll be happy here."

Her greeting was so unexpected it almost bowled me over. No head nurse had *ever* spoken to me that way. In fact, none had ever done more than assign me my duties and imply: "Snap to it, and no nonsense!"

I soon realized that "Old Stinkhole" wasn't so bad after all. True, it was cheerless and smelly, and the patients did need

a lot of care. But there was an esprit among both staff and patients that I've rarely seen anywhere.

One day, when I had a particularly difficult patient—a 10-year-old boy who'd lost both legs under a moving train—Miss Tompkins came into the room.

"Here, I'll give you a hand," she said. She showed me how to turn the lad and change the linen without causing him too much distress. She was so quick, so deft, it seemed no work at all.

"I hope some day I'll be able to do things as easily as you," I said.

"No question about it," she replied. "When you've been at it twenty-five years, as I have, you'll be even better. You're the best student I ever had on the floor."

Her words were like a shot in the arm. Even though I suspected she told other students the same thing, I glowed with a pride I'd never experienced in my life.

Before I left "Old Stinkhole" I resolved to find out *why* Miss Tompkins was so different from our other head nurses. What was it that had made her decide to praise her students rather than

keep them—as was the usual custom—under constant criticism?

One day I asked her. And she told me:

“You should have known me years ago,” she said. “The students used to call me The Broomstick—behind my back, of course. They said that’s what I rode to work on. But that was before I learned about God’s angels.”

“God’s angels?” I asked.

“Yes. From the Eighth Psalm: ‘What is man, that Thou art mindful of him? . . . For Thou hast made him a little lower than the angels . . .’”

Reading the Psalm, she said, had set her thinking. Up to then she had spent so many years being autocratic and keeping the students scared of her that none of them dared to “reason why” when she gave an order.

They all hated her, she knew—but no more than she hated them. She hated her job, too. She hated the hospital, the patients—everyone. She soon came to hate herself, and with the worst hate of all.

But now, reading the Psalm, she decided to try an experiment: She would call a moratorium on

criticism. She would look for something to praise in her student nurses. She would encourage every student on her floor.

“If a student vexed me,” she said, “I just repeated, over and over, ‘Thou hast made her a little lower than the angels.’ When extra busy, I shortened the quotation to ‘God’s angels.’”

Soon she found that she no longer hated her job, the hospital—or anyone. She realized the chaotic state of mind she’d lived in so long had been of her own making.

In sum, she discovered that to find one’s life one must lose it in others. She came to realize that kindness, tolerance, and love aren’t just things to hear about in church on Sunday.

Everyone noted the change in her. It was obvious. For she found satisfaction in her work that she’d never dreamed of.

I remember a student saying to her, “Miss Tompkins, I hope when I’m a head nurse that *my* students will be inspired the way you’ve inspired me.”

“Inspired!” she exclaimed. “Now don’t you go giving me the credit. The credit belongs to God. All I did was tune in. Anyone can do it!”

END

TRACHEAL FENESTRATION

*This dramatic new surgical procedure
spells increased responsibility and opportunity
for the nurse*

By Patricia D. Horgan, R.N.

In the wake of many new surgical procedures come new nursing techniques. Tracheal fenestration is an example. It gives rise to a need among nurses to learn still another technique: that of aspirating retained bronchial secretions.

Until recently, these secretions have been aspirated only

by the doctor with his bronchoscope.

A tracheal fenestration creates a permanent opening into the trachea. Aspiration of secretions through this opening lets the patient with a pulmonary disorder (such as suppurative lung disease, bronchiectasis, or emphysema) breathe more easily.

Here's the result of a tracheal fenestration, with the skin valves healed. When closed, as shown, the valves make the fenestration airtight and leakproof. Result: The patient can breathe, speak, and cough normally.

If the secretions in such a patient are retained, they may so limit his oxygen reserve as to make him practically an invalid. If, on the other hand, the secretions are aspirated, he may be able to live almost normally, perhaps even returning to work.

Tracheal fenestration is similar to tracheostomy in that both provide an opening into the trachea.

But, instead of the metal tube used in a tracheostomy, the tracheal fenestration creates a skin-lined tube (the skin taken from the anterior surface of the patient's neck) that extends outward from the trachea. The external opening of the skin tube is covered with two doorlike skin valves. When closed, these valves

let the patient breathe, cough, and speak normally.

Because the delicate skin tube and valves of the fenestration take about two weeks to heal, the patient has to have also a *temporary* tracheostomy so that secretions may be aspirated during the healing period. The tracheostomy is done at the same time as the fenestration. When the fenestration has healed, the tracheostomy tube is removed. The opening is then allowed to close.

After surgery you'll aspirate—and teach the patient to aspirate—the tracheobronchial secretions. This is done with six catheters of different diameters. Each catheter is semirigid and curved. Each is marked off in centime-

Tracheobronchial aspiration procedure: Spread skin valves apart with thumb and forefinger.

Insert catheter into bronchial tree, thence into desired lung.

Close end of Y-tube with thumb.

Withdraw catheter slowly.

TRACHEAL FENESTRATION

ters so that the user can tell how far into the bronchial tree the tip has penetrated.

You attach the widest catheter to the suction machine, then thread it through the fenestration and bronchus, and then into the right or left lung. Turning the catheter slightly directs it into the desired lobe.

A Y-tube is attached to the catheter, and you place your thumb over the open end of it. This closes the suction circuit, and secretions from the lobe are aspirated as you withdraw the catheter.

You repeat this procedure with the remaining five catheters, each time using a narrower one, until secretions have been aspirated from even the smallest bronchi.

Patients Can Do It

With proper instruction, most patients are soon able to master the insertion and direction of catheters. You can help by giving your patient a diagram of the bronchial tree and a mirror so that he can watch as he does the aspiration.

Once a day, the catheters are placed for forty-five minutes in a boat containing a chemical steri-

lizing agent, then flushed with sterile water and wiped with moist sterile gauze. To preserve the catheters' natural curve, a sterile stylet is inserted in each. They are then placed in a dry sterile boat.

Dr. Edward E. Rockey, clinical instructor in surgery at New York Medical College, who performed his first tracheal fenestration in 1956 and his twenty-first in October, 1958, believes this procedure has marked advantages over the conventional tracheostomy.

Why It's Better

His reasons: First, because there is no need for a metal tube to keep the opening patent, strictures or irritation of the trachea are eliminated. Second, the patient can breathe and speak normally.

"And," adds Dr. Rockey hopefully, "tracheobronchial aspiration is the first procedure to give symptomatic relief to the victims of cystic fibrosis whose lungs become filled with secretions."

Once again, a new technique underscores the fact that as medicine develops new and better procedures, nurses must grow in skill and competence. **END**

How to Put Your Ideas Across

Here's the secret of engaging successfully
in group discussions—whether formal or informal

By Fred DeArmond

Dale Carnegie's old formula doesn't fit when you're talking things over with other nurses: You're not trying to "win friends and influence people." Instead, you're trying to influence friends without alienating them.

It can be done. I've watched nurses who are extremely skillful at this. They manage to disagree without being disagreeable. They win their points without losing friends.

The secret of their success? I'd say it boils down to six simple rules. Try them the next time you take part in a professional talkfest:

1. Inquire first, before disagreeing. When a nurse makes an assertion to which you take exception, ask her why she holds that view. The purpose of such a tactic is twofold. First, it'll cause her to amplify, clarify, or qualify her position. This may

SCIENTIFIC COSMETOLOGY

approaches the problem of the

Advancing Research in Dermatology

Much remains to be learned of the fundamental processes in aging of the skin^{1,2} and of "...the way in which the skin's chemical constituents and physiologic functions can be altered under the influence of modern medicinal preparations at our command."¹ Significant investigations of the factors underlying skin aging have been sponsored by the cosmetic industry and accomplished by its investigators.³

Changes in Aging Skin

The biologic process of aging is irresistible⁴ and atrophy of the skin starts at about 40.⁵ The rosy, smooth and elastic skin of youth eventually becomes pale, wrinkled and flaccid.⁵ Loss of elasticity is an outstanding feature.^{2,6} The sebaceous glands become much reduced in number, except for the nose and forehead.³ Alterations in the surface texture and oiliness of the skin occur.⁷ The characteristic dryness appears because both epidermis and dermis lose their ability to take up water.³

The Role of Heredity, Environment, Hormones

Heredity plays an important role in the rate at which skin ages.^{2,5} Environment—heat,² cold,² humidity,² light^{2,5}—has a considerable effect: prolonged exposure to sunlight ages skin prematurely.⁹ Inadequate hormonal secretion produces skin changes associated with aging.^{2,7,9,10} This is indicated by the dry, inelastic, wrinkled skin associated with waning of the ovarian hormones,¹¹ "...the rejuvenation of old skin by the topical application of endocrines..."⁹ and "...the proliferation of the epithelium and increased vascularity and elasticity of the dermis following administration of steroid hormones..."¹⁰

Evolution of Topical Hormone Therapy: 1. Estrogens

The first physiologically active cosmetics for mitigating the effects of aging were estrogen creams which had "...at least in some cases, a marked effect upon the condition of the skin, giving it a more youthful appearance."¹² Although some observers^{13,11} have expressed doubts that aging skin can be influenced by estrogen in the quantity present in creams, there appears to be definite clinical and histologic "...support for the anti-wrinkling effect produced by the use of hormone cosmetics, based upon (a) the thickening of the epidermis, (b) the plumping of the collagen fibres."¹⁵

Local application of estrogens to the thinned skin of older women increases water content and fibroblastic activity.¹⁰ In addition, improvement in the elastic properties of the skin,¹⁷ "...proliferation of the epidermis, progressive development of the rete pegs and papillae... new formation of elastic fibrils and increased vascularization of the cutis..."¹⁰ have been noted. Neither oral¹⁰ nor parenteral¹⁷ estrogen produced these effects.

Evolution of Topical Hormone Therapy: 2. Progesterone

The sebaceous glands are holocrine, producing their oily secretion, sebum, by breakdown of their cells. Sebum forms an emulsion that covers the skin with a protective film and permeates the outer layer of the stratum corneum.¹⁸ This helps maintain normal hydration and pliability.¹⁸ As the skin ages, the sebaceous glands are reduced in number³ and "the gradual diminution of sebaceous secretion leads to drying of the skin and loss of superficial lustre..."¹⁹

the AGING SKIN:

Restoration of Moisture and Surface Oil

The size, development and number of sebaceous glands determine the amount of sebum.^{18,20} "It is only by the division and multiplication of [sebaceous]...cells that sebum can be formed."²¹ "Progesterone definitely stimulates sebaceous gland growth,"²² by increasing the number of sebaceous cells.¹⁸ This action of progesterone, applied topically, increases the amount of surface oil.²³

Development of a Topical Hormone Cream with Estrogens and Progesterone

As a pioneer in cosmetic hormone therapy, Helena Rubinstein initiated dermatologic, endocrinologic and cosmetologic studies to determine the effects of preparations containing both female hormones. A face cream, containing 10,000 I.U. of estrogens and 5 mg. of progesterone per ounce was formulated. This was tested for efficacy and safety in conformance with the same stringent standards designated by official regulatory bodies for prescription pharmaceuticals.

As shown by *in vivo* osmic acid staining of inunction sites and by histochemical studies, nightly application of both hormones increased natural oil and emolliency²⁴ and produced hydration, or plumping, of the skin.²⁴ Two-thirds of the women noted benefits to their skin.²⁴ Objective improvement was observed in over half of the women by dermatologic examination.²⁴ No effect on menstrual cycles and no significant changes in vaginal smears or urinary estrogen excretion were detectable.²⁴ Freedom from irritation and sensitization was shown by the Schwartz-Peck method (48-hour closed patch and re-test) and the more rigorous Draize-Shelanski method (continuously reapplied closed patch multiple insults).²⁴

Beauty through Science: Ultra Feminine

Until quite recently little significance was attached to the dermatologic effects and cosmetic benefits of topical therapy with either or both female hormones. For today's maturing woman, with many productive years before her, such therapy can perform important beautifying, psychological, social and clinical functions. A product of scientific cosmetology, Ultra Feminine can help her retain her attractiveness and youthful appearance well past "middle age." You may recommend it with confidence.

HOW TO PUT YOUR IDEAS ACROSS

show that, after all, no essential difference of opinion exists.

If your questions don't accomplish that much, they may at least uncover some basic ground of agreement. That's the best possible start toward reconciling conflicting views.

To Uncover Weaknesses

A "why" question may cause your colleague to state a reason or theory that's even more vulnerable to attack than her original statement. This should indicate how you can answer her argument most effectively.

Similarly, if you're the speaker and a listener expresses disagreement, ask her right off *why* she disagrees. Then, when you answer her, you can attack her real reason for objecting to what you've said.

2. *Don't stick your neck out too far.* At a district meeting, an

O.R. supervisor talked on the importance of the scrub nurse being an R.N. Another nurse then asked why a properly trained aide couldn't do this job.

"Well," said the supervisor, "you may find some aides scrubbing in other parts of the country, but you won't find them doing so in this district."

"I beg your pardon," the nurse replied, "but in our hospital we use aides exclusively as scrub nurses."

All the speaker could say then was that her assertion had been too broad. She added that *she'd never known* of a case where aides had been used successfully; which is what she should have said in the first place.

By qualifying a statement, you leave open an avenue of escape. Don't burn your dialectic bridges behind you. You may need them later.

In a Bedside Manner of Speaking... **Keep on Your Toes with NōDōz**

When you're feeling drowsy on an important case but have to stay awake, keep on your toes with NoDoz. Handy NoDoz tablets help restore your normal alertness. Safe as coffee, but much more convenient.

NōDōz®

3. *Avoid direct contradiction.* The worst way to take exception is to begin with "That's where you're wrong" or "No, that isn't true." Such remarks carry an implication that the other person is either ignorant or deliberately deceitful.

The objectionable statement may have been a tentative view tossed off without reflection. It may be subject to reversal when countered by the question method. But when you use a contradictory tone, the effect is to make your colleague stiffen and defend her position. She then feels duty-bound to justify her first thought.

Don't Embarrass Her

No one enjoys being corrected in a misstatement of fact. So when you set the record right, remember your opponent's need to save face.

Preface your correction with,

"Haven't you forgotten something there?" Or say, "That's an easy point to overlook because there have been so many changes lately in hospital practices, but I believe you'll find that . . ."

If you're registering disagreement with another nurse's conclusion, word your dissent as an opinion rather than as a dogmatic contradiction. Don't say, "That's not the cause." Say, "In my opinion, that's not necessarily the cause."

The first sounds like a challenge of the speaker's veracity. The second merely states a point of view.

Another way to dissent without direct contradiction is to agree with part of an assertion while disagreeing with another part. When Dr. Johnson said something reflecting adversely on the scenic beauties of Ireland, Boswell asked whether the

ROMILAR, the non-narcotic cough specific, has an antitussive effect which is equal, if not superior, to that of codeine . . . Yet Romilar has no codeine-like side effects, such as addiction or constipation. No Rx required.

HOW TO PUT

YOU

King's Causeway was not worth seeing. "Worth seeing, yes," answered Johnson. "But not worth going to see."

By expressing your agreement first, you soften your dissent. A smart commentator will say: "I liked Miss White's remarks on the two-year course very much. From one point of view there's much to be said for her contentions. But now I suggest you consider another side of the question."

Remember that any sincere nurse who states an erroneous opinion honestly believes she's right. Her error lies in failing to see the issue from the opposite side also and to appraise the relative value of the two views.

Don't Question Motives

4. *Don't impute ulterior motives to someone who holds an opinion contrary to yours.* "It is a common mistake in judgment and a dangerous one in conduct," wrote the celebrated Junius, "first to look for nothing in the argument proposed to us but the motive of the man who uses it, and then to measure the truth of his argument by the motive we have assigned to him."

A nurse once made a speech reporting on a new prosthetic device she had helped to devel-

YOUR IDEAS ACROSS

op. One of her listeners was offensively skeptical. "Miss Lee," she asked, "just what is your pecuniary interest in this device?"

"None whatever," was the reply. "I've waived all my royalties in the hope of keeping down the cost to the patient. Now I'll be generous and not ask what pecuniary interest prompted your question."

The person who starts by impugning motives is in a weak position. Be sure of your ground before trying it. Better still, don't try it at all.

5. *Don't let an opponent re-*

HOW TO PUT

strict you to a choice of two extremes. Familiar to all verbal jousts is the debater who tries to pin you down to his plan or to chaos. Few propositions are all black or all white. The truth usually lies somewhere between the two extremes.

A Fool's Choice

About twenty years ago, we Americans faced this harsh set of alternatives: "Shall nine old men rule the country, or shall the Supreme Court's power to declare a law unconstitutional be repealed?" The correct answer, of course, was "Neither!"

Some years later, another false choice was offered: "Compulsory health insurance, or laissez-faire medicine?" Here again, there was a third solution better than either of the two mentioned.

A state nurses' association was hotly debating its legislative program. The nurse who finally engineered an agreement was the one who said:

"Some of you tell me that the amount proposed for this program is too large to be raised but that you will contribute to any fund that's reasonable. Others say that the amount is too small but that if we set up a legislative war chest at least big

YOUR IDEAS ACROSS

enough to make our objectives possible, they'll subscribe liberally.

"Now, of course, we could never name a figure that every member would consider ideal. The sum we're asking you to approve is about midway between these two extremes. It's what Theodore Roosevelt would have called a realizable ideal. Let's approve it."

The opposition, finding itself divided, agreed to go along with

- ▶ AMUSING . . .
- ▶ AMAZING . . .
- ▶ EMBARRASSING . . .
- ▶ INTERESTING . . .

No doubt one of these adjectives describes some incident that has occurred in the course of your work as a nurse.

Why not share the story with other R.N.s?

If it's accepted for publication, you'll receive \$15-\$25.

modern woman's way to internal cleanliness

*Far more effective than any
homemade solution, yet
safe for delicate tissues —
Zonite for the douche!*

Today, thanks to nurses' recommendations, many women are discovering an intimate "clean feeling" they've never known before. They are discovering Zonite — the modern woman's way to internal cleanliness.

Zonite is a *proven* antiseptic, based on the trusted Dakin's solution you know so well . . . far more effective than homemade douches. In fact, Zonite is the one effective liquid specially made for feminine hygiene.

Recommend this modern woman's way to internal cleanliness. For a professional sample of Zonite, write to Dept. RN-1208, Dunbar Laboratories, Wayne, N. J.

HOW TO PUT YOUR IDEAS ACROSS

the middle-of-the-road minority.

6. *Don't quibble.* Those querulous perfectionists who write the editor to correct his syntax also attend meetings and get involved in luncheon discussions. A well-known speaker once said that about half the questions thrown at him had either been answered in his formal address or weren't worth answering.

Why correct a colleague on hairline points? You can't hope to root out all the error in the world. "Mortal man cannot afford to sit down in the conflux of two eternities and split hairs," W.C. Brann once said in rebuking a grammar shark.

Don't Let 'Em Scare You

On the other hand, just because the speaker is a V.I.P., don't be awed into silent agreement with something of importance that you do not believe in.

You have every right to make even an expert defend her views.

Speak out when you differ with a professional colleague—but do it with good humor. Your frankness need not lose you friends. When Herbert Spencer felt impelled to reply in print to something his old friend Thomas Huxley had said, he wrote Huxley a note reaffirming their friendship.

'You Can Damn Me'

In reply, Huxley told his friend: "You have what the Buddhists call a stock of accumulated merit. If you should ever feel inclined to 'damn my eyes,' you can do so and have a balance left."

Now let's suppose that you're doing the talking and that you're trying to make a point. Obviously, any question asked you in good faith deserves a straight-

HOW TO PUT YOUR IDEAS ACROSS

forward answer. The question may seem absurdly elementary to you, but answer it anyway.

If you're stumped by a query, you can always say, "That's a good question," and suggest that since Miss Jones is in the room she may care to answer it.

Or you may simply say, as one well-known nurse-educator often does: "I don't know. My ignorance about many things is monumental."

In group discussion, then, you can disagree without being disagreeable. Simply follow these six rules:

1. Ask questions to clarify a point or to maneuver the other person into a vulnerable position.

2. Qualify your statements, so that in case of refutation you'll still have an avenue of escape.

3. Correct another nurse's errors in a way to salve her pride.

4. Assume that any colleague's views are honestly held.

5. Refuse to accept a Hobson's choice of two extremes offered by an opponent.

6. Be unwilling to argue about trifles.

Offer expires Feb. 28, 1959 R.N.

THE 1958 RN AWARDS

A NEW CONTEST FOR NURSES INTERESTED IN WRITING

\$100.....for the best original article written by a nurse and found acceptable for publication.

\$100-25...for all other original articles written by nurses and found acceptable for publication.

Up to \$10...for original article ideas submitted by nurses and found suitable for development by RN's staff.

■ RN believes that a nurse is the best judge of what interests other nurses. So we're encouraging you to distill something valuable out of *your* experience and put it in writing for the benefit of your colleagues everywhere. Your contribution can be either an article or an article idea. You may submit as many as you wish.

■ Your *article* will have the best chance of winning if it's (a) not more than 1,500 words long; (b) filled with examples, anecdotes, and cases in point drawn from actual experience; and (c) limited to *just one aspect* of any broad subject, whether it be clinical, human interest, economics, technical, or personal.

■ Your *article idea* will have the best chance of winning if it's (a) between 100 and 300 words long; (b) specific rather than general; and (c) detailed enough so that our editors will understand *exactly* the point you have in mind.

■ Entries should be addressed to Awards Editor, RN, Oradell, N.J. Manuscripts should be typed, triple-spaced on one side of the paper only, and accompanied by a self-addressed envelope and return postage.

Closing date for entries in the 1958 RN Awards contest has been extended to December 31, 1958, due to the great number of requests received from nurse-writers who were unable to meet the original June 30 deadline.

**TOMORROW'S CANNED FOODS MAY BE EVEN BETTER
BECAUSE OF EXPERIMENTS WITH NUCLEAR ENERGY!**

This is an artist's rendition of an actual color photograph of an irradiation rack, illuminated solely by visible blue light from Cerenkov radiation.

One experiment calls for the exposure of frozen canned foods to gamma irradiation. This photo, taken at the Argonne National Laboratory, shows cans being placed in an insulating cylinder. The

cylinder will be sealed within one of the aluminum urns (at right), then lowered into the water of the radiation canal. There it is exposed to rays yielding from one to two million roentgens an hour.

High energy irradiation, alone or combined with thermal processing or freezing, shows interesting possibilities as a means for preserving packaged foods. To explore fully this new technique, American Can Company scientists are participating in an extensive irradiation research program.

Part of this work is carried on through cooperative projects at government and university laboratories, part through independent studies at Canco's multi-million-dollar Research Center in Barrington, Ill. As a result of this program, food for the nation's dinner tables some day may be sterilized by nuclear energy.

AMERICAN CAN COMPANY

Varicose Veins

Continued from 49

who have to sit for long periods, physicians advise getting up at least every half-hour to walk around.

While sitting, place your feet on a stool or ottoman. But don't let the backs of your calves rest on anything for long periods because this tends to shut off the venous return.

Doctors also advise against wearing an elastic girdle if you sit much. A girdle, like round garters or like crossing your legs

at the knees, has a tourniquet effect.

Nurses with varicosities should not forget that heavy lifting exerts a strong downward pressure on the venous flow. If you *must* lift a heavy object, take a deep breath and hold it during the lift. This puts to use the negative pressure that's created in the chest cavity when you inhale. This negative pressure helps draw the venous blood up toward the heart.

Dr. Howard Mahorner, director of the Mahorner Clinic, also in New Orleans, reminds nurses

help for the NURSE

(as well as your patient)

Aspergum, aspirin in chewing gum form, works promptly to relieve headache, muscular aches or simple sore throat while you are on-the-go.

Chewing Aspergum brings welcome, long-lasting comfort to busy people.

Packaged in a convenient, easy to carry, box of 16's. Also economical bottles of 36 for the home or office. Ideal for children, too. Just drop us a line if you'd like a supply of Aspergum for personal use.

Busy Nurses Like Its Convenience !

**GOMCO No. 789
PORTABLE
ASPIRATING PUMP**

Designed with the busy nurse in mind, the 789 is saving valuable time and energy in thousands of hospitals. It is easy to clean, very simple to operate and requires a minimum of maintenance. Lightweight (only 16 lbs.), it is easily carried wherever the need arises. Its wide uses include general post-operative work, removal of mucous from throats of new-born and for polio cases. Accurate regulator valve and gauge give precision control of suction from 0" to 20" of mercury. Built to Gomco's uncompromising standards of quality. Depending on number of beds, every hospital needs from 7 to 14 of these units.

Ask your Gomco dealer about the many advantages of the 789 Aspirating Pump. He'll be glad to arrange a demonstration.

Gomco Safety Overflow Valve (patented) prevents pump damage by closing suction system should moisture enter valve.

RN • DECEMBER 1958 81

VARICOSE VEINS

with varicose veins of the importance of frequent rest. "Plan your day to include several periods when you can lie down and elevate your legs," he advises. "If you should injure a leg, stop working for several days. Even slight trauma to varicose veins can cause thrombosis and leg ulcers."

Keeping your weight down is an important rule in avoiding the possible complications of varicose veins.

Even more important is a follow-up examination every six months.

Surgery's the Answer

If in the course of one of these check-ups a positive Trendelenberg test shows that your valves have become incompetent, your doctor may advise surgery. This means removing the now useless saphenous and connecting veins

and letting the deep veins take over their work.

Even if your deep circulation is somewhat impaired, this may be advisable. Superficial varicosities contribute to venous stasis, so putting the saphenous veins out of action actually improves the deep circulation.

They Aren't Inevitable

"You don't necessarily get varicose veins *because* you're a nurse," says Dr. J. C. Luke, Assistant Professor of Surgery at McGill University. "But if you're a nurse who gets them, and if your work keeps you standing or sitting all day, they may give you a lot of trouble. Putting yourself under a doctor's care as soon as symptoms appear, and visiting him regularly every six months thereafter, is the best way to avoid the often crippling complications of this disease." **END**

LAVORIS...a

**favorite for personal
and professional use!**

LAVORIS
is the original zinc
chloride solution,
highly regarded
by the dental and
medical professions
for many years.

Stimulating Astringent
LAVORIS
Mouthwash and Gargle

LAVORIS is not, and has never claimed to
be, a germ killer. Its thorough cleansing
action is chemo-mechanical.
It coagulates and removes viscid mucus
and accumulations and septic exudates.
This effective cleansing is accomplished
without damage to tissues... in fact,
the stimulating effect of Lavoris on
capillary circulation improves
tissue tone and resistance.

SUGGEST
regular use of Lavoris
to your patients.
Available in 4 oz.,
9 oz., and 20 oz.
bottles at all
drug stores.

DIRECTIONS:
As a mouthwash,
dilute with 1
to 3 parts water.
As a gargle, dilute
with equal
amount of hot
water. As a spray,
use full strength or
dilute with equal
parts water.

a moderate reduction in fat indicates cereal and milk serving

Medical and nutrition authorities recommend moderation and reasonableness in food choice as a best guide to good health. When a moderate reduction of dietary fat is indicated, a good choice is the cereal and milk serving for breakfast and the late evening snack.

Both the breakfast cereal and the milk contribute

well-balanced nourishment and provide quick and lasting energy. This serving, as shown below, is a good source of many nutrients and provides about 10 per cent of the daily recommendations of high quality protein, important B vitamins, and essential minerals. Served with nonfat milk, the fat content is very low.*

for faster, more effective relief of
headache and dysmenorrhea pains

give your patients

Trigesic

Squibb Analgesic Compound

rapid-acting, non-narcotic pain reliever

advantages • provides prompt, gratifying pain relief within minutes
• marked analgesic-antipyretic effect • especially well tolerated
• non-addicting, non-habit forming • contains
acetyl-p-aminophenol—the chief active metabolite
of acetanilid and acetophenetidin

indications simple headache • common colds • dysmenorrhea • myalgia
• migraine • bursitis

Dosage: 1 or 2 tablets as indicated. Do not exceed
8 tablets in 24 hours.

Supply: White, scored tablets, vials of 12 and 50; bottles of
100 and 1000. Each tablet contains: 0.125 Gm.
acetyl-p-aminophenol, 0.23 Gm. aspirin, and 0.03 Gm. caffeine.

support medical education!

Every practicing physician has heard the appeal of the medical schools for desperately needed financial support.

The American Medical Education Foundation has an annual quota of \$2,000,000 to be subscribed by practicing physicians.

Considering direct gifts, contributions through their Alma Mater and Alumni Committees and through the American Medical Education Foundation, this 2 million dollars has been greatly exceeded.

But time flies — the need is immediate — so this is another appeal for your immediate contribution either through your Alumni Committee Secretary or direct to the American Medical Education Foundation.

Do it TODAY!

High-concentration topical salicylate-menthol therapy (BEN-GAY) offers safe, penetrating relief of painful joints and muscles resulting from overexertion.

New, objective evidence:

A double-blind study¹ has reaffirmed the exceptional efficacy and safety of conservative, local treatment of chronic rheumatic disorders with BEN-GAY® (BAUME BENGUÉ), a high-concentration salicylate-menthol compound.

The local and systemic effects of BEN-GAY were evaluated by entirely objective methods in 211 subjects of both sexes suffering from various types of chronic arthritis, bursitis, neuralgia, myalgia and lumbago. Changes in range of joint motion were determined by goniometer and by flexion. Topical application of BEN-GAY measurably improved articular function in 94% when physical therapy was also used, and in 61% without adjunctive treatment. Efficient absorption of salicylate through the skin was indicated by an average urinary excretion of 15 mg. in 24 hours. No ill effects were reported or observed.

Benefits of Topical Salicylate in chronic rheumatic disease

Menthol-induced hyperemia plus high local concentration of salicylate has been recently rediscovered as one of the safest and most promptly effective remedies for rheumatoid discomfort due to exposure.

This controlled study offers new evidence of the efficacy and safety of local treatment of chronic rheumatic disease with BEN-GAY, one of the safest and most reliable formulae at the physician's disposal. BEN-GAY is available in two strengths, *Regular and Children's*. THOS. LEEMING & CO., INC., 155 East 44th St., New York 17, N.Y.

¹Brusch, C.A., et al.: Md. State Med. J.; 5:36, 1956.

More efficient salicylate penetration of treated area and quicker relief of pain is now made possible by water-washable, new GREASELESS-STAINLESS BEN-GAY.

Have you heard about **ROMILAR** for cough?

It's not a narcotic—yet its specific cough-calming effect is equal, if not superior, to that of codeine... and it doesn't have codeine's side effects. No constipation or nausea, no drowsiness, no tendency to addiction. Romilar comes as a syrup, tablet, or expectorant (with ammonium chloride). Prescription not required.

Romilar® Hydrobromide—brand of dextromethorphan hydrobromide

**Now! The perfect coffee for ...
*people-who-sell-shoes-to-women***

In fact, brand-new Aroma-Roast Sanka is perfect for anyone who lives in this high-tension world.

New Sanka is the *only* coffee that delivers real coffee aroma and true coffee flavor, but without caffeine . . . 97% of the caffeine is removed. Sanka can't add to tension or disturb sleep.

You'll like it, Doctor, and so will your patients.

**NEW Aroma-Roast
INSTANT SANKA COFFEE**

A fine coffee from
General Foods

MISS PHOEBE

NO. 27 IN A SERIES

"... a big red one with a coaster brake and a super-duper ride like Aunt Phoebe's E & J chair!"

One-arm drive model permits control of both wheels from one side of chair.

When it comes to comfort, maneuverability and smooth riding, modern Everest & Jennings chairs *do* make a "super" standard for comparison. A far cry from the popular old conception of "wheel chair confinement," bright, lightweight, folding Everest & Jennings chairs have restored the delight of going places and doing things for thousands.

NEW COUGH MODERATOR

SPECIFIC ANTITUSSIVE...

"COTHERA"[®] moderates intensity and frequency of coughing through a selective action apparently on the medullary cough center ... subdues but does not abolish the cough reflex. The natural reflex for removal of secretions is retained.

ACTS WITHIN MINUTES—LASTS FOR HOURS...

"COTHERA" provides a local anesthetic and soothing demulcent action to induce almost immediate relief of 'sandpaper' throat and 'annoying tickle' ... followed by sustained moderation of the cough reflex, lasting for four to six hours and frequently throughout an entire night with one dose.

NON-NARCOTIC...

"COTHERA" is nonaddictive; does not cause respiratory depression, gastric irritation, or constipation. It is well tolerated by children and elderly patients, even after continued use. (Antitussive action is equal to $\frac{1}{4}$ gr. codeine per teaspoon dose.)

GUARDS AGAINST BRONCHOSPASM...

"COTHERA" exerts a mild musculotropic spasmolytic action tending to protect against possible harmful effects and cough-aggravation of bronchospasm.

CHERRY-FLAVORED...

"COTHERA" is completely acceptable to all age groups.

Indications: "COTHERA" Syrup is specifically indicated for irritating, useless, or chronic coughs such as those associated with the common cold, children's diseases, excessive smoking. It may be used safely for short-term or prolonged treatment.

Dosage: Adults and children over 8 years—1 to 2 teaspoonfuls (25-50 mg.) three or four times daily. Children, 2 to 8 years— $\frac{1}{2}$ to 1 teaspoonful three or four times daily.

Supplied: 25 mg. per 5 cc. (teaspoonful), bottles of 16 fluidounces and 1 gallon.

Ayerst Laboratories  New York 16, N. Y. • Montreal, Canada

FASTER ACTING

still another reason for recommending BUFFERIN

Rapid pain relief, as you know from your own experience, is an important factor in evaluating the overall effectiveness of an analgesic.

Bufferin acts significantly faster than plain aspirin¹... 10 minutes after taking Bufferin, the blood salicylate levels are more than twice as high as those obtained with plain aspirin. Even after an hour, aspirin fails to attain the salicylate levels produced by Bufferin.

Fast Action—Still another reason why so many doctors and nurses recommend Bufferin for trouble-free pain relief. And Bufferin is one of the best-tolerated of all oral salicylates.

**For better-tolerated pain relief
that starts faster...recommend**

BUFFERIN[®]

Each Bufferin tablet combines 5 Gr. of aspirin with aluminum glycinate and magnesium carbonate.
